

Bartonellen (Rochalimaea)

Bartonella can trigger **multi-system diseases** and **vasculo proliferation**. Especially in immune deficiency patients one can find "**bacillary angiomatoses**", reddish-brown papules or nodules that may ulcerate or cause flat areas on bone lesions or "**peliosis hepatis**" blood-filled liver cysts.

Bartonellen können **Multisystem-Erkrankungen** und **Vaskuloproliferationen** auszulösen. Vor allem bei immuninsuffizienten Patienten kann man „**bazilläre Angiomatosen**“ finden, rötlich-braune Papeln oder Knötchen, die ulzerieren können oder flächige Bereiche über Knochenläsionen verursachen oder „**Peliosis hepatis**“, mit Blut gefüllte Leberzysten.

Breitschwerdt EB (2013) Educational Programs: Seminars and Webinars. **Bartonellosis: a cause of vascular inflammation and chronic disease** in humans and their pets. <http://c4tm.org/center/edu/>

“Although the present review is focused on organisms of the genus *Bartonella*, there are numerous other frontal pathogens (e.g. influenza virus, methicillin-resistant *Staphylococcus aureus*, SARS coronavirus and monkey pox) and stealth pathogens (e.g. *Anaplasma phagocytophilum*, *Borrelia burgdorferi*, *Coxiella burnetii*, *Ehrlichia* spp. and *Toxoplasma gondii*), shared between man and small companion animals, for which a coordinated One Health approach to investigation and application of our proposed Koch's postulate of comparative disease causation would be of benefit to animal and

human health. In conclusion, we propose the addition of a fifth Koch's postulate to address comparative disease causation where the same infectious agent is isolated or DNA sequences are found in at least three mammalian genera. In the examples provided in this manuscript, this postulate has been achieved for *Bartonella* spp. and vasoproliferative lesions in cats, dogs, a horse, people and a steer, granulomatous inflammatory lesions in cats, dogs and human patients, endocarditis in cats, cows, dogs and human patients and chronic bacteraemia in cats, dogs, people and numerous rodent species. The authors hope that the postulate of 'comparative infectious disease causation' can be used by other infectious disease researchers to assist with efforts to define the role of specific or coinfecting infectious agents in patients with chronic, complex disease expression ».
